

MASSEY FERGUSON

THE GENUINE CHOICE

GENUINE MASSEY FERGUSON SEATS

QUICK REFERENCE GUIDE

Choose a seat to support your customer’s well-being

Back pain and spinal problems are one of the biggest health issues amongst farmworkers. With the help of modern tools, more work can be done from inside the cab, and the time spent seated has increased. Problems are partially due to the physical demands and ergonomically poor choices when working. There are a lot of tools available to make the work easier and take the workload off from the body of a driver. When the majority of the workday might be spent sitting, it is especially important to pay attention to the working conditions in the cab and having a proper seat.

When seated in a moving vehicle, the driver will experience movement and vibration, causing strain to the spinal core. The seat that is designed for a tractor will reduce the vibration caused by the movement and make it easier for the spine and joints of the driver. The right seat will support the driver and allow the right amount of suspension. Your seat and its suspension will have a direct influence on the physical stress experienced by the driver through the amount, magnitude and length of vibration.

Cabs come in different shapes and sizes, and so do seats. When choosing a new seat the first important criteria is the space available in the tractor. The new seat should fit into the cab, allowing the optimal use of control devices and features of the seat.

Make sure that seat is selected to fit the cab but also to support the well-being of the driver, being not only comfortable but also designed to reduce the long-term impacts of being seated in a moving vehicle.

Today there is a wide variety of seats available for different tractors and different drivers. You can find seats from the simple mechanical seat to high-end seats with air suspension, heating and air conditioning.

This selection of Massey Ferguson seats is here to help you to find a suitable seat for each driver and their Massey Ferguson tractor.

Do not hesitate to contact your Massey Ferguson dealer support if there are any questions in selecting a seat for your customer’s Massey Ferguson.

MECHANICAL SUSPENSION

The seat height adjustment in mechanical suspension seats is carried out in 3 stages via a latching mechanism. The exact setting based on the driver’s weight is made manually via a setting lever. As a result the driver will experience maximum suspension comfort in mechanical seats. Mechanical suspension is suitable for standard, smaller size tractors.

PNEUMATIC SUSPENSION

Pneumatic suspension means easy and simple height and weight adjustments by pressing or lifting the weight/height adjustment lever. The good operating and suspension comfort of the pneumatic suspension supports the driver to stay operational longer. Pneumatic suspension is suitable for standard tractors.

LOW FREQUENCY SUSPENSION

Low frequency suspension is the vibration-optimized air suspension perfect for heavy vehicles. The low frequency suspension absorbs vertical vibrations and impacts and prevents a rocking of the seat in critical operating conditions. The positioning system does not allow adjustment of the seat to the highest or lowest position, making sure that there is always a remaining suspension stroke of 10 mm in both directions, upwards and downwards. This feature guarantees minimum impact on the driver. In addition, the positioning system automatically regulates the weight setting. Low frequency suspension is suitable for medium and large tractors.
